Kiawe Corporation is seeking three (3) adjacent Police Departments in the Greater Phoenix Arizona Area to create the most advanced software program package in the Police Community. Each department will assign an officer to the project whose responsibility is to design what is currently needed in Police Work.

The main effort will be Records and Crime Analysis. The Police Departments will most likely already have a Computer Aided Dispatch and we will automatically interface that data into the Records component.

The Police Work Designers will bring the needs of their respective Foot & Car Patrols, Crime Annalists, Dispatchers, Investigators, and Administrators to the development project which will be assisted by Apollo Representatives. Kiawe will automate the aforesaid needs within three (3) months. The new design will be the most current POLICE WORK SYSTEM in the United States.

The incentive for participating Departments is they will receive unlimited usage of the software at no cost.

For Police Communities at-large the benefit is this software will cost less then 10% of traditional software.

---

The following Police System is a starting point that can be altered as directed by the aforesaid designers so we do not have to start from zero. This example Police System can serve as a metric for the Police Department to experience how quick and effective Apollo is in automating work systems compared to—traditional enterprise modeling tools, software development methodologies, and writing computer code.
